

From a trader's checklist to an automated pipeline

Automating a discretionary RSI-MACD mean-reversion method (students report a ~76% win rate) on the trader's own ~100-ticker watchlist, long and short. I bring the strategy and the judgment; I use Claude Code to implement and automate it — coded in Python, run on QuantConnect, shipped with a one-command deploy. Version-controlled on GitHub. Work in progress.
