

From a trader's checklist to a **validated edge**

A faithful Python & QuantConnect port of a discretionary RSI-MACD mean-reversion method, stress-tested inside a Claude iteration loop. The headline 88% win rate proved to be **selection bias**; on a survivorship-free universe the method is high-win-rate but breakeven — and a disciplined train/test loop isolated a smaller, **genuine out-of-sample edge**.
